Best emergency alarm for elderly

Choosing an elderly personal alarm for you or a loved one can be a confusing process. There are many different alarms and service providers to choose from and the differences between them can be hard to identify. Despite performing the same basic function, different alarms and services are suitable for different people. It is useful investing time to find the alarm that is best for your individual needs. This short guide will highlight the key features to look for in both your personal alarm and your service provider. While appearance may not seem to be important in terms of functionality, what the alarm button looks like can significantly change the likelihood of being worn. This could be because of simply dislike the appearance, or even the feeling that they have connotations of fragility that make the wearer feel less capable. There are now pendant buttons that are designed to look like jewelry and can be worn around the neck on a silver chain or around the wrist with more than the look of modern technology. While many pendant alarms look very similar, there are some key features you should be aware of that may differ from model to model. The key between these is battery life. The pendant alarm will be in almost constant use, probably worn whenever you are in and around the house, it is important to be able to be sure that it is always operational. A long battery life means you don't have to worry about how much charge is left and whether you're covered. High-quality alarms typically have a battery life of more than 5 years. Many pendant buttons are sealed units and you will need to replace from time to time, some buttons now have battery change functionality. Low battery warnings should be sent to the response centre, giving the equipment supplier time to replace the button in a timely manner. Pendant alarms are connected to a basic unit connected to a telephone line, usually centrally located in your home. Different alarm models will have different operational intervals from the respective base unit. While all should cover even a large house, some are able to cover a much wider area, which means that you can be protected while enjoying your garden or doing other tasks in the immediate surroundings of the house. If service providers offer a home visit to install the alarm, a perimeter test will determine the area where you are protected. If a much larger range is required, it may be appropriate to analyze GPS tracking devices with an SOS button. (See GPS Trackers below). It is also important that itself is easy to use. Most aged care alarms are operated by pressing a button located in the center of the front face of the pendant. You must be able to easily press this button. Accidental activation is a potential problem that good alarms try to prevent by pressing the button, so pressing it against a surface or hitting it against a piece of furniture won't activate the alarm. Some alarm alarm have accessories available to reduce the pressure required to fully press the button if dexterity is affected. Modern personal alarms are usually waterproof, allowing them to be worn in the shower. It is important to make sure that yours is, as bathrooms are a high-risk area for slips and falls and are therefore where an alarm is particularly useful. For older people more active there are also options that can provide coverage outside the home. These relatively new devices incorporate technology, such as GPS trackers and roaming SIM cards. This allows the user to signal their suffering from anywhere and open a call to the alarm itself, either with an emergency response center or with a specified contact. They can also be used to locate the wearer if necessary. Recent developments have given GPS Trackers increased reliability. They are the device of choice where wandering is a problem as geo-fences can be set to alert the contacts in question if the wearer comes out of a pre-set area. Many suppliers will offer the detectors falls as an option to be worn instead of, as well as the alarm button. Fall detectors can be set to different sensitivity levels as needed and are a good solution if the wearer may be unlikely or does not want to press an alarm button for help. Detectors falls into the latest GPS devices are probably the best yet developed. For a pendant alarm to be truly effective it should be worn at all times. Therefore, it is important that you or your loved one are wearing comfortable all the time. It should not impact on daily tasks, nor does the wearer feel uncomfortable with its presence. There are several factors to consider when identifying the alarm that is likely to be most comfortable to wear. Some of these are relatively simple, would be judging the size and weight of the alarm. Most modern alarms are smaller and lighter than their predecessors. Many alarms have more than one option for the method of wearing. Typical options include neck pendant or wrist strap. With some alarms you will be able to change the method of wearing simply by changing the attachment, while others will be less flexible. Different neck cords and wrist straps can also be composed of different materials, which can have an impact on personal comfort. The slightly larger GPS device can be worn on a secure lanyard around the neck or on a clip that can attach to any waist or belt that can fit more actively. Choosing the right service provider is as important as choosing the right alarm. Many companies that offers care alarms varies greatly in the services they offer, ranging from relatively basic to full service providers. One of the key things to looking into in a service provider is the help it provides in identifying the best alarm model for you. This service is a real lifeline and quality really matters. Some vendors offer a size that fits all the product, which you simply post to yourself and leave the rest up to you. More suppliers will visit the prospective personal wearer, take the time to assess their needs and then help the wearer make an informed decision. These vendors also tend to provide a professional installation rather than expecting you or your family to struggle with wires and cables. The installer will be able to accurately identify the optimal location in the house for the alarm receiver unit and ensure that it is working correctly. They will also be able to assist with the paperwork, ensuring that all relevant information, such as medical details, is recorded for use by the emergency response centre. Suppliers who simply post equipment out will not be found necessary to change their working method, however, for those offering a personalized service, changes in methodology will have been implemented to ensure the time needed to identify the correct alarm solution for the individual, perhaps through telephone consultation without haste, or through minimal contact installation procedures where self-installation is not possible. Alarm services for the elderly have traditionally been provided via analogue telephone lines. By 2025, analogue lines will be phased out and all lines will be digital. It's important to know that emergency alarms will work as lines change. Suppliers will need to make changes to keep the alarms going to continue to provide security after 2025. The helpline has been particularly active to ensure that their service will be suitable for analogue post-telephony, offering digitally activated alarms that will provide a seamless service as the phone lines are digitized. GPS/mobile technology also has a prominent role to play as changes are made to phone lines. A 24/7 high-quality emergency response centre is another essential part of a good service, ask if the response centre is accredited by the TSA, the Technology Care Standards Authority (TEC). The best service providers will also provide a customer service hotline to help with non-emergency questions and troubleshooting. They will also stay in proactive contact with you to ensure the best possible service. Price clarity is another important factor when selecting a service provider. Make sure that the announced figure includes everything and that there are no hidden costs. Some providers have additional costs for each use of the button or for battery maintenance and replacement. Good suppliers should be able to give you a clear breakdown of prices, and include maintenance, etc., as part of their service. It is also important to know what kind of price increases could occur in the future, a for example, Helpline has committed to never increase their price by a higher percentage than state pension increases for that year. Helpline are an established provider of full-service healthcare-driven, with a rich experience in providing personal alarms for the elderly and vulnerable. We are committed to providing a continuous 5-star service, starting with helping you select select alarm for you or the person you love. Helpline works tirelessly to ensure that the equipment provided is suitable for the user and its connectivity. Why don't you call us on 03458 247 999 for a non-binding discussion about your situation?
